The invention is a reusable mailable card including a first panel having a major front face to receive an image or text and a major rear face. A second panel including a first portion securable to the first panel so as to provide in combination with the first panel a pocket to receive a relatively flat data storage medium and a second portion associated with the first portion and securable to the rear face to close the pocket. Securing means manipulated by a user to secure the second portion to the rear face to close the pocket, an opening means manipulated by a user to permit removal of said medium from said pocket and means to reclose said pocket to permit said card to be remailed. While FR 2838671 (published prior to the international filing date but later than the priority date of the present application) and JP 2000-168874 both provide a pocket to receive a relatively flat data storage medium, neither provides means to reclose said pocket to permit said card to be remailed. No prior art was found which provided such a card including a pocket to receive a relatively flat data storage medium and means to reclose said pocket to permit said card to be remailed.
